1. Goal of the evaluation

I used the evaluation to check whether football interested users can understand and use the Coach Attack Explorer without a long explanation. The dashboard is made for people who know football, such as players, coaches and fans, but not necessarily for people who are used to data dashboards.

The goal was not to prove that the dashboard is perfect. I wanted to see where users hesitate, which terms are unclear and whether the main workflow makes sense. The main workflow is to choose a tournament, choose a team, select one goal attack, replay the attack step by step and then compare the team with other teams from the selected tournament.

The evaluation was kept small and practical. Three participants used the dashboard, completed short tasks and filled out a SUS questionnaire. During the test I focused especially on unclear labels, wrong interpretations and views that needed more explanation.

2. Participants

Three football interested users tested the dashboard.

Participant 1 was Yannick Geiger. He is a player and football fan. His football knowledge is medium and his dashboard experience is medium. He tested the dashboard on 13.05.2026.

Participant 2 was Kenan. He is a coach and football fan. His football knowledge is high and his dashboard experience is medium. He tested the dashboard on 20.05.2026.

Participant 3 was Ivan Batista. He is a player and football fan. His football knowledge is high and his dashboard experience is high. He tested the dashboard on 13.05.2026.

This participant group was useful because all three people understand football, but they did not use the dashboard in exactly the same way. This helped me see which problems came from the football terms and which problems came from the interface. Yannick and Kenan had medium dashboard experience, while Ivan had more dashboard experience. Because of that, it was useful to compare whether unclear parts appeared only for less experienced users or also for someone who is more comfortable with dashboards.

3. Tasks used in the evaluation

Task	Action	What it tests
Task 1	Load a tournament	Can the user find the starting point and understand that the dashboard is tournament-based?
Task 2	Choose team and goal example	Is the filter workflow logical?
Task 3	Replay the attack	Can the user follow the goal build-up step by step on the pitch?
Task 4	Read tournament patterns	Can the user understand quick, medium and long build-up charts?
Task 5	Compare team style	Can the user interpret the team style map and directness ranking?

The participants tried the available tournaments in the dashboard.

4. Task completion

Task	Result
Task 1	3/3 completed
Task 2	3/3 completed
Task 3	3/3 completed
Task 4	3/3 completed
Task 5	3/3 reached the view, but 2/3 needed explanation for Directness Rank or the team style map

The first four tasks caused almost no problems. All participants could load a tournament, select a team, select a goal and follow the replay. The first real difficulties appeared in the team comparison view. The participants could use it, but Directness Rank and the team style map needed more explanation than the replay view.

5. Results by task

Task	What I observed	What I changed or kept
Task 1: Tournament	The entry point was mostly clear. Yannick and Ivan saw the tournament dropdown quickly. Kenan needed a short moment but still found it logical.	Add or keep a short start sentence near the top of the dashboard.
Task 2: Team and goal	The workflow was understood by all three participants. Team first and goal example second felt logical.	No major change needed. The selected team and selected goal should stay visible.
Task 3: Replay	This was the strongest part of the dashboard. Participants could follow the attack step by step. The Next button was especially useful.	Keep the replay central. It is the clearest link between data and football understanding.
Task 4: Patterns	The bar charts were easy to read. The scatterplot was less immediate and needed a short look, especially for Kenan and Ivan.	Add a short explanation of what one point in the scatterplot means.
Task 5: Team comparison	This was the most difficult part. Directness Rank was not always clear at first, and the team style map became harder when many teams were visible.	Explain that lower rank means fewer passes before goals. Highlight the selected team more clearly in the style map.

6. Direct feedback from participants

Person	Topic	Feedback summary
Yannick	Replay	With the Next buttons I could see well how the attack was built up.
Yannick	Team style map	The team style map was the most difficult because several pieces of information are shown at the same time.
Kenan	Start	At the beginning I had to look for a moment, but the tournament dropdown was visible. After that it was logical.
Kenan	Scatterplot	Most diagrams were clear, but with the scatterplot I first had to think about what the points mean.
Ivan	Replay	The replay was most helpful because the attack is shown directly on the pitch instead of only as numbers.
Ivan	Comparison	Directness Rank was unclear at the beginning. Quick, medium and long build-up should also be explained shortly.

7. SUS results

ID	Person	SUS answers Q1-Q10	SUS score
P1	Yannick Geiger	4, 2, 4, 2, 4, 2, 4, 2, 4, 2	75.0
P2	Kenan	4, 2, 3, 2, 4, 3, 5, 2, 5, 2	75.0
P3	Ivan Batista	3, 3, 4, 2, 4, 2, 3, 2, 3, 3	62.5
Average			70.8

The average SUS score was 70.8.

I interpret this as acceptable for a student prototype, but not as a perfect result. This also matches the written feedback. The main workflow and the replay were understandable, but the comparison view and some terms needed clearer explanations.

Ivan gave the lowest SUS score with 62.5. This is useful because he had high dashboard experience and was more critical. His answers showed that the dashboard works, but that some labels still need explanation before the user can fully understand the comparison part.

8. Main findings

The clearest result was that the replay worked best. All three participants could follow a selected goal attack step by step. The football pitch made the data easier to understand because users could see the attack as a sequence instead of only reading numbers.

The tournament and team selection were understandable enough. Users understood that the dashboard depends on the selected tournament and that the available teams and goals change after the selection.

The more difficult parts were the comparison views. Directness Rank was the most important unclear term. Some users first read it as a quality ranking, but in this dashboard it only describes playing style. A team with a lower directness rank uses fewer completed passes before goals. This does not automatically mean that the team is better.

The team style map was useful, but it needed more guidance than the replay. Users could understand it after reading the labels or after a short explanation, but it can feel busy when many teams are visible at the same time.

The scatterplot was usable, but it needed more time than the bar charts. Users first had to understand that each point represents one goal build up and that the axes show passes and duration.

9. Changes made after the evaluation

Based on the feedback, I kept the main structure of the dashboard. The replay, filters and team comparison were useful, so I did not rebuild the whole app. Instead, I focused on making the existing views easier to understand.

I added a clearer instruction at the top of the dashboard. It now explains the basic order of use: choose tournament, choose team, choose goal and replay the attack.

I also added a clearer explanation that the dashboard only analyses goal attacks. This is important because the dashboard does not show every attack or every shot. Each selected sequence ends with a goal.

Another important change was the explanation of the arrows in the pitch replay. The arrows show event data, mainly completed passes and the final shot. They are not full tracking paths. If two arrows do not connect perfectly, this does not mean that the data is wrong. It can happen because the receiver moves with the ball before playing the next pass.

I also made colour adjustments to improve readability. The goal was not to make the dashboard more decorative, but to make selected elements, replay steps and important information easier to see.

Finally, I made the wording around directness clearer. Directness is presented as a style comparison and not as a quality ranking. This was important because one participant first interpreted the rank as a performance ranking.

10. Short conclusion

In this small test, the main workflow of the Coach Attack Explorer was understandable for the three participants. They were able to load tournament data, select a team, choose a goal and follow the goal replay. The replay was clearly the strongest part because it connects the data to a familiar football view.

The main weakness was not the replay, but the comparison area. Directness Rank, quick, medium and long build up, the scatterplot and the team style map need short explanations. This does not mean that the dashboard fails. It means that the dashboard should guide users more clearly when they move from one concrete goal replay to a tournament level comparison.

For the final submission, the evaluation is useful because it shows both success and real problems. The dashboard is usable, but the final version should keep explanations visible and avoid presenting style comparisons as quality rankings.
